EXECUTIVE SUMMARY

A whole sediment toxicity test was conducted by Environmental Enterprises USA, Inc. (EE USA) to determine potential toxicity of an Emory River site sediment sample to *Ceriodaphnia dubia* neonates. Three samples were used in this test: Emory River site sediment identified as BULKSED-ERM5.5-EEUSA-052411 (ERM5.5); Emory River reference sediment identified as BULKSED-EMORYREFERENCE-EEUSA-052511 (ERS); and Emory River water identified as BULKSW-ERM9.0-EEUSA-060611 (ERW). Several dilutions of ERM5.5 prepared with ERS were tested with four concurrent controls. A moderately hard synthetic freshwater (MHSW) only control was included to assess test organism health. Separate laboratory control sediment (LCS) exposures with either MHSW or ERW were included to assess test acceptability requirements.

C. dubia survival and reproduction in the ERM5.5 treatments were compared to survival and reproduction in an ERS control with ERW. Survival and reproduction of *C. dubia* neonates in the ERM5.5 treatments were not reduced when compared to survival and reproduction in the ERS control. Test results are shown in Table 1.

Table 1. *Ceriodaphnia dubia* Chronic Survival and Reproduction Test Results for ERM5.5.

SURVIVAL	REPRODUCTION
NOEC / LOEC = 100.0 / > 100.0%	NOEC / LOEC = 100.0 / > 100.0%
IC_{25} > 100.0%	IC_{25} > 100.0%

INTRODUCTION

EE USA was contracted by Tennessee Valley Authority (TVA) to complete whole sediment toxicity tests with Emory River sediment and water samples using *C. dubia* neonates. The project is described in TVA's Sediment Toxicity Study Design [1]. Site sediment samples were collected from eight representative locations on the Emory River. Emory River reference sediment samples and river water samples were collected upstream of the site sediment locations. The two reference sediment samples were mixed together 50:50 and homogenized in the field. TVA's contractors, Jacobs Engineering and Restoration Services, Inc., coordinated sample collection in the field and delivery of the samples to EE USA. The samples were delivered to EE USA on June 7, 2011, on ice and with custody seals intact (Appendix D).

This test, which was performed on one (ERM5.5) of the eight sediment samples obtained from the Emory River, was conducted in accordance with American Society for Testing and Materials (ASTM) [2] and U. S. EPA [3] toxicity testing methods. Test organisms were cultured at EE USA and were 9.5 to 17.5 hours old when this test was initiated. Ten replicates of each control treatment and six ERM5.5 concentrations were prepared the day before the test was initiated. ERM5.5 dilutions were prepared with ERS. ERM5.5 concentrations tested were 10.0, 20.0, 40.0, 60.0, 80.0, and 100.0%. A portion of the overlying water in each replicate was replaced daily. This test was initiated June 10, 2011, at 1530 and completed June 17 at 1715.

MATERIALS AND METHODS

C. dubia was cultured and maintained in MHSW at $25 \pm 1^{\circ}\text{C}$. Test organisms were selected from adults producing at least ten in their third or subsequent brood. Only ten neonates from any one adult were used so that one replicate in each treatment was populated with a neonate from the same adult. Test organisms were fed *Selenastrum capricornutum* (SCAP) and Yeast-Cerophyl-digested Tetramin (YCT) daily at the rate of 0.1 mL each per 15 mL of water.

ENVIRONMENTAL ENTERPRISES USA, INC.

On June 7, 2011, the ERM5.5, ERS, and ERW samples were delivered to EE USA and stored at 0.1 to 6°C (Appendix D & Table 2). Two 1-liter containers each of ERM5.5 and ERS were put into separate mixing bowls. Each 2-liter sediment sample was mixed for approximately five minutes with a KitchenAid Model KHM7TGCS hand-held mixer set at position "3", 580 ± 5 rpm. On June 9th (Day -1), the density of each sediment, LCS, ERS, and ERM5.5, was measured and the test treatments were prepared (Appendix A, page 1). Eight-dram shell vials were used as test chambers. The vials were washed with soap and water and rinsed with acetone, 10% HCl, deionized water, and MHSW prior to being used as test chambers. Test chambers were labeled with test concentration, replicate, and EE USA's project number. Dilutions of ERM5.5 were made with ERS according to the calculations on page 1 of Appendix A. For each treatment, 400 mL of sediment was prepared, homogenized, and then 5 mL were transferred to 11 test replicates. The 11th replicate of each treatment was used for water quality only.

Table 2. Emory River Site Sediment, Reference Sediment, and Water Samples.

TVA Sample ID	EE USA Sample ID	Date Collected	Date Received
BULKSED-ERM5.5-EEUSA-052411 Composite Sample, Site Sediment (ERM5.5)	E-384-11	May 24, 2011 @ 0955	June 7, 2011
BULKSED-EMORYREFERENCE-EEUSA-052511 Composite Sample, Emory Reference Sediment (ERS)	E-382-11	May 25, 2011 @ 0855	@ 0740
BULKSW-ERM9.0-EEUSA-060611 Grab Sample, Emory River Water (ERW)	E-381-11	June 6, 2011 @ 1349	June 7, 2011 @ 0740

SCAP and YCT were added to aliquots of the overlying waters, MHSW and ERW; 6.0 mL each of SCAP and YCT was added to 900 mL of MHSW and 12 mL each of SCAP and YCT was added to 1800 mL ERW. The MHSW and ERW aliquots were warmed up to 25 ± 1°C. Twenty mL of MHSW were transferred to 11 test replicates of the MHSW only control. LCS, No. 5 sand supplied by EE USA and wetted to saturation with MHSW, was homogenized with a stainless steel spoon and five mL were transferred to 22 test replicates. Eleven LCS + MHSW replicates received 20 mL MHSW and 11 LCS + ERW replicates received 20 mL ERW. Twenty mL of ERW were added to each replicate of the ERS and ERM5.5 treatments.

After dispensing the sediments and water, the test chambers were placed in an environmental chamber at 25 ± 1°C with a photoperiod of 16 hours light and 8 hours dark. The test was not aerated. Initial water quality parameters (dissolved oxygen (DO) and temperature) were measured daily in the 11th replicate of each treatment. At the end of each 24-hour exposure period, prior to renewal, the ending DO and temperature in each treatment were recorded (Appendix A, pages 9 – 12 & Table 3). Alkalinity, hardness, conductivity, pH, DO, total residual chlorine, and ammonia were measured in ERW and each batch of MHSW (Appendix A, page 2 & Table 4).

The test was initiated June 10th (Day 0) after 15 mL of water were removed from each replicate of each treatment and replaced with water into which proper aliquots of food had been added. One *C. dubia* neonate was transferred to each replicate, and then the test chambers were placed in an environmental chamber. On Days 1-6, the test exposures were renewed as follows:

1. The *C. dubia* in each replicate and approximately 5 mL of the water in the replicate were transferred to a 30-mL disposable plastic cup.
2. Additional water equivalent to a total of 15 mL was removed from the replicate.
3. 15 mL of fresh MHSW or ERW as appropriate was transferred to the replicate.
4. The *C. dubia* was transferred back to the replicate.

Water was removed from and added to each replicate with a 25-mL pipette. *C. dubia* were transferred with disposable 3.5-mL transfer pipettes. Survival was recorded daily (Appendix A, pages 3 - 8). Reproduction was also recorded and newly produced neonates discarded before renewal. The test was terminated after seven days, after \geq 60% of each set of control organisms released their third brood.

The endpoints for the chronic test were survival and neonate production. The test acceptability criteria were 80% or greater survival in the LCS + MHSW control and an average of 15 or more young per surviving female in the control solutions (60% of surviving control females must produce three broods).

The response used in the statistical analysis of the survival data was the proportion of test organisms surviving in each treatment chamber after seven days. Fisher's Exact test was used to test for a significant difference between survival in the ERS + ERW control and each ERM5.5 concentration. The response used in the reproduction data analysis was the total number of neonates produced per replicate. Reproduction data were tested for normal distribution and homogeneity of variance using the Kolmogorov D and Bartlett's tests, respectively. Reproduction data were normally distributed, equal in variance, and evaluated by Dunnett's Test. The statistical tests were performed using ToxCalc Version 5.0.32 at a probability level of 0.05 [4].

Sensitivity of test organisms to a known toxicant was determined by performing a chronic Standard Reference Toxicant (SRT) test, CD1106, with potassium chloride (Sigma Chemical, Lot 060M0116V). The most recent SRT test was initiated on May 26, 2011, with less than 24-hour-old *C. dubia* neonates.

RESULTS AND DISCUSSION

The control *C. dubia* met the test acceptability criteria of 80% or greater survival and an average of 15 or more young per surviving female in the LCS + MHSW control solution. One hundred percent survival occurred in the LCS + MHSW control. Ten out of ten (100%) of the control females produced three broods; the mean brood size was 26.5.

The No Observed Effect Concentration (NOEC) for survival was 100% ERM5.5. The Lowest Observed Effect Concentration (LOEC) was > 100.0% ERM5.5. The IC₂₅, a point estimate of the concentration that causes a 25% reduction in survival was > 100.0% ERM5.5 (Appendix B, page 1 & Table 5).

The NOEC for reproduction was 100.0% ERM5.5. The LOEC was > 100.0% ERM5.5. The Minimum Significant Difference percent for this reproduction data set was 10.3% (Appendix B, page 2). The IC₂₅, a point estimate of the concentration that causes a 25% reduction in reproduction was > 100.0% ERM5.5 (Appendix B, page 2 & Table 5).

Table 5. Summary of Percent Survival, Mean Reproduction, and Survival and Reproduction NOECs, LOECs, and IC₂₅s for ERM5.5.

	LCS + ERW	ERS + ERW	10% ERM5.5	20% ERM5.5	40% ERM5.5	60% ERM5.5	80% ERM5.5	100% ERM5.5
% Survival	100	100	100	100	100	100	100	100
Mean Reproduction	26.7	26.2	27.6	28.6	28.6	29.1	30.7	28.3
	NOEC		LOEC			IC₂₅		
Survival	100% ERM5.5		> 100% ERM5.5			> 100% ERM5.5		
Reproduction	100% ERM5.5		> 100% ERM5.5			> 100% ERM5.5		

In summary, *C. dubia* survival and reproduction were not significantly reduced in any control or ERM5.5 treatment. Survival and reproduction statistical data for the MHSW only, LCS + MHSW, and LCS + ERW controls are presented on pages 3 and 4 of Appendix B.

The neonates used in the potassium chloride SRT met all of the quality control test parameters. The following SRT control charts are given in Appendix C:

- Survival IC25 with ± 2 SD Control Limits
- Survival IC25 %CV with 75th and 90th Percentile Warning Limits
- Survival PMSD
- Reproduction IC25 with ± SD Control Limits
- Reproduction IC25 %CV with 75th and 90th Percentile Warning Limits
- Control Reproduction with Lower Limit
- Control Reproduction %CV with TVA Limit
- Reproduction PMSD
